French standard approved

by decision of the Director General of AFNOR on November 20, 1999 taking effect on December 20, 1999.

Replaces the approved standard NF A 49-186 dated August 1987.

Correspondence

The European standard EN 10253-1:1999 has the status of French standard.

Analysis

This document defines butt-welding pipe fittings (elbows — reducers — T-fittings — convex bottoms — caps) made up of carbon steel delivered without specific examination.

These pipe fittings can not be considered as meeting the essential requirements of the Directive Equipment under Pressure (Directive 97/23 dated 29/05/1997).

Descriptors

Technical International Thesaurus: connections for welding, steels, information, manufacturing, chemical composition, grades: quality, dimensions, dimensional tolerances, appearance, tests, inspection, marking.

Modifications

With respect to document replaced, complete revision of the document.

EUROPEAN STANDARD

EN 10253-1

NORME EUROPÉENNE

EUROPÄISCHE NORM

September 1999

ICS 23.040.40

English version

Butt-welding pipe fittings - Part 1: Wrought carbon steel for general use and without specific inspection requirements

Raccords à souder bout à bout - Partie 1: Acier au carbone pour usages généraux et sans contrôle spécifique

Formstücke zum Einschweißen - Teil 1: Unlegierter Stahl für allgemeine Anwendungen und ohne besondere Prüfanforderungen

This European Standard was approved by CEN on 2 July 1999.

CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration. Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the Central Secretariat or to any CEN member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the Central Secretariat has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Czech Republic, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and United Kingdom.

Foreword

This European Standard has been prepared by Technical Committee ECISS/TC 29 "Steel tubes and fittings for steel tubes", the secretariat of which is held by UNI.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by March 2000, and conflicting national standards shall be withdrawn at the latest by March 2000.

This European Standard has been prepared under a mandate given to CEN by the European Commission and the European Free Trade Association. This European Standard is considered to be a supporting standard to those application and product standards which in themselves support an essential safety requirement of a New Approach Directive and which make reference to this European Standard.

In writing the European Standard EN 10253, the competent committee recognized that there are two broad types of products commonly used and decided to reflect these in the standard by the differentiation between two parts.

Firstly the committee recognized the need to provide a basic type in which the minimum wall thickness of the fitting is guaranteed without formal reference to the pressure resistance. This type is considered in Part 1 ; it consists of fittings which are not intended to be used in applications covered by the European Pressure Equipment Directive.

Secondly the equipment standards under the Pressure Equipment Directive will impose that the fitting has a defined resistance to internal pressure. This approach imposes enhanced requirements that are considered in Part 2.

Part 1 : fittings are not designed to fulfil specific design requirements in regard of pressure resistance and are only defined by their chemical composition, mechanical characteristics and dimensions (outside diameter, wall thickness, radius ...).

Part 2 : fittings are designed to fulfil specific design requirements.

It is the ultimate responsibility of the user to select the appropriate part for the intended application.

NOTE This European Standard intends to reflect the needs of various national markets ; consequently it offers in a normative annex an alternative solution for an associated combination of steel grade and dimensions (see clause 1).

According to the CEN/CENELEC Internal Regulations, the national standards organizations of the following countries are bound to implement this European Standard: Austria, Belgium, Czech Republic, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and the United Kingdom.

1 Scope

1.1 Scope

This European Standard specifies requirements for steel butt-welding fittings (elbows and return bends, concentric and eccentric reducers, equal and reducing tees, dished ends and caps) made of wrought carbon steel and delivered without specific inspection.

The fittings described in this European Standard do not fulfil specific design requirements ; consequently they cannot be considered as conforming to the Essential Requirements of the Pressure Equipment Directive (Directive 97/23/EC of 29.05.1997).

It specifies :

- the steel grade and its chemical composition ;
- the mechanical characteristics ;
- the dimensions and tolerances ;
- the technical conditions for inspection and testing ;
- the marking, packaging and inspection documents.

When steel grade S265 is specified in 4.1.2, the normative annex A applies and takes preference over conflicting requirements in the relevant areas of the main text.

Another part of this European Standard (describing fittings intended to fulfil the Essential Requirements of the PED) is :

- Butt-welding pipe fittings - Part 2 : Wrought carbon and ferritic alloy steels with specific inspection requirements.

1.2 Limitation of use

The allowed pressures and temperatures are the responsibility of the customer according to the state of the art and in application of the safety coefficients specified in the applicable regulations, codes or standards.

1.3 Technical delivery conditions

Unless otherwise specified in this European Standard the general technical delivery conditions specified in EN 10021 apply.

2 Normative references

This European Standard incorporates by dated or undated references, provisions from other publications. These normative references are cited at the appropriate places in the text and the publications are listed hereafter. For dated references, subsequent amendments to or revisions of any of these publications apply to this European Standard only when incorporated in it by amendment or revision. For undated references, the latest edition of the publication referred to applies.

3 Definitions and symbols

3.1 Definitions

For the purpose of this European Standard the definitions in EN 10020, EN 10021, EN 10052 and EN 10079 shall apply. In addition following definitions apply :

type

For elbows and return bends the type defines the bending radius of the piece. Possible types are :

- type 2D : $R \approx 1D$;
- type 3D : $R \approx 1,5D$;
- type 5D : $R \approx 2,5D$.

welded fitting

Fitting made from a welded tube or fitting where welding is part of the fabrication of the fitting.

3.2 Symbols

DN	Conventional dimension used in piping ; non measurable value (See EN ISO 6708)
D	Specified outside diameter for elbows, return bends, equal tees and large diameter for reducers and reducing tees, in millimetres
D ₁	Specified small outside diameter for reducers and reducing tees, in millimetres
T	Specified wall thickness at the welding ends, in millimetres
T ₁	Specified wall thickness at the welding end of the D ₁ face of reducers and reducing tees, in millimetres

¹⁾ In preparation. Until this document is published as a European Standard, the corresponding national standard should be agreed at the time of enquiry and order.

R	Radius of elbows and return bends, in millimetres
C	Centre to centre distance for return bends ($C=2F$), in millimetres
B	Face to top distance for return bends, in millimetres
F	Distance from the axis of the branch outlet to the face of the centre body of tees, in millimetres
G	Distance from the axis of the centre line to the face of the branch outlet of reducingtees, in millimetres
h	Height of the straight part of dished ends, in millimetres
H	Face to centre distance for 45° elbows, in millimetres
K_1	Internal height for dished ends, in millimetres
K_2	Total height for caps, in millimetres
L	Face to face distance for reducers, in millimetres
Q	Tolerance on the form for fittings
R_m	Tensile strength at room temperature, in Newton per square millimetre
R_{eH}	Upper yield limit at room temperature, in Newton per square millimetre
A	Percentage of elongation at rupture, with reference to a gauge length of $5,65\sqrt{S_0}$
HB	Brinell hardness

4 Information to be supplied by the purchaser

4.1 Mandatory information

4.1.1 Designation of fittings

The fittings are designated by their name, reference to this European Standard and the following :

- elbows, return bends :
 - for elbows : The type (2D, 3D or 5D), the angle (45° or 90°), the outside diameter D and the wall thickness T ;
 - for return bends : The type (2D, 3D or 5D), the outside diameter D and the wall thickness T ;
- reducers :
 - the form (1 or 2), the large diameter D and the wall thickness T, the small diameter D_1 and the wall thickness T_1 .
 - The form does not apply for eccentric reducers ;

- tees :
 - for equal tees : The outside diameter D and the wall thickness T ;
 - for reducing tees : The large diameter D and the wall thickness T, the small diameter D_1 and the wall thickness T_1 ;
- dished ends :
 - the outside diameter D and the wall thickness T ;
- caps :
 - the outside diameter D and the wall thickness T.

4.1.2 The enquiry and order shall include following information :

- quantity ;
- designation of fittings ;
- steel grade (see clause 6 and annex A) ;
- reference to this European Standard.

4.2 Options

A number of options are specified in this European Standard and these are listed below. In the event that the purchaser does not indicate his wish to implement any of these options at the time of enquiry and order, the supplier shall supply in accordance with the basic specification :

- type of tube as starting product (seamless or welded). See 5.2.1 ;
- definition of coating. See clause 11.

4.3 Examples

EXAMPLE 1 :

1000 elbows in accordance with this European Standard of type 3D with angle 90° and dimensions 60,3 X 2,9 made of steel grade S235.

1 000 elbows - EN 10253-1 - type 3D - 90° - 60,3 X 2,9 - S235.

EXAMPLE 2 :

50 elbows in accordance with this European Standard of type 3D with angle 90° and dimensions 273 X 9,5 made of steel grade S265.

50 elbows - EN 10253-1 - type 3D - 90° - 273 X 9,5 - S265.

EXAMPLE 3 :

2 000 concentric reducers in accordance with this European Standard of form 2 with dimensions 219,1 X 6,3 - 139,7 X 4,0 made of steel grade S235.

2 000 concentric reducers - EN 10253-1 - form 2 - 219,1 X 6,3 - 139,7 X 4,0 - S235.

5 Manufacturing process

5.1 Steelmaking process

The steelmaking process of the base material is at the discretion of the manufacturer. The steels shall be fully killed.

5.2 Fitting making-process and heat treatment

5.2.1 Fitting-making processes

The allowed processes and the relevant starting products are given in Table 1.

Table 1 — Fitting-making processes - Starting products ^a

Process for fittings	Hot Deformation		Cold Deformation		
	Bending	Stamping or Forming followed by machining ^b	Bending	Stamping ^b	Forming ^b
Elbows	1-2	1-2-3	1-2	1-2-3	1-2-3
Return Bends					
Reducers	-	1-2-3	-	1-2-3	1-2-3
Tees	-	1-2-3-4-5	-	1-2-3	1-2-3
Dished ends and caps	-	3-5	1-2-3	-	3
^a Starting products. 1 Seamless Tube 2 Welded Tube 3 Plate 4 Forgings 5 Bars					
^b For these processes welding may additionally be used.					

The process is at the discretion of the manufacturer.

Where tubes are used as starting material, the following conditions apply :

- the choice of the type of tubes (seamless or welded) is left at the discretion of the manufacturer ;
- helical submerged arc welded (SAW) tubes are not permitted ;
- for welded tubes, the full length of the weld seam shall be nondestructively tested in the tube condition in accordance with EN 10246-7 or prEN 10246-8, to acceptance level L4.

Option 1

The type of starting product shall be as defined in the order.

5.2.2 Fusion welding

In the case of the fusion welding process the weld seam shall include at least one external bead and one internal bead, as far as the internal face is accessible.

The welding process, the welders and/or the welding operators shall be qualified in accordance with EN 288-1 or EN 287-1.

Any weld made during the fitting-making process shall be tested in accordance with 9.4.6.

5.2.3 Heat treatment

Fittings produced by cold deformation shall be subsequently normalized.

Fittings produced by hot deformation may be delivered without heat treatment if hot deformation produces a technically equivalent metallurgical structure with the mechanical characteristics according to Table 3.

This condition is regarded as satisfied when the final forming operation is completed between 750 °C and 980 °C.

Dished ends produced by cold deformation need not be heat treated.

6 Metallurgical properties

6.1 Chemical composition

The cast analysis as reported by the steel manufacturer shall comply with the requirements given in Table 2.

Table 2 — Chemical composition

Steel grade	C max. %	Si max. %	Mn max. %	S max. %	P max. %
S235	0,16	0,35	1,2	0,025	0,030

NOTE 1 Elements not included in this table shall not be intentionally added to the steel without agreement of the purchaser, with the exception of elements used for deoxidation. However, residual elements may be tolerated provided that the mechanical properties and applicability of the product are not adversely affected.

NOTE 2 See Annex A for details of alternative grade S265.

6.2 Mechanical characteristics

The mechanical characteristics (at room temperature) shall comply with the requirements given in Table 3.

Table 3 — Mechanical characteristics

Steel Grade	R _{eH} min. N/mm ²	R _m N/mm ²	A min. %	HB max.
S235	235	360-500	25	170

The mechanical properties may be determined on the finished product or on the base material provided it is in the same heat treatment condition as the fitting it represents.

6.3 Weldability

Fittings covered by this European Standard are weldable. Moreover account should be taken of the fact that the behaviour of the steel during and after welding is dependant not only on the steel, but also essentially on the conditions of preparing and carrying out the welding and on the final use of the fitting.

7 Dimensions and tolerances

7.1 Dimensions

For reducers and tees it is not mandatory that the produced pieces correspond to the exact representation in the figures. Only the dimensions given in the relevant tables shall be respected.

7.1.1 Elbows and return bends

Elbows type 3D and type 5D shall be produced according to Figures 1 and 2, elbows type 2D according to Figure 2. Return bends shall be produced according to Figure 3. Dimensions shall be in accordance with Tables 4, 5 and 6.

Figure 1 — 45° Elbow

Figure 2 — 90° Elbow

Figure 3 — Return bend

7.1.2 Reducers

Concentric reducers shall be produced according to Figures 4 and 5 (resp. form 1 and 2). Eccentric reducers shall be produced according to Figure 6. Dimensions shall be in accordance with Tables 7 and 8.

Figure 4 — Concentric reducer - Form 1

Figure 5 — Concentric reducer - Form 2

Figure 6 — Eccentric reducer

7.1.3 Equal tees

Equal tees shall be produced according to Figure 7. Dimensions shall be in accordance with Table 9.

Figure 7 — Equal tee

7.1.4 Reducing tees

Reducing tees shall be produced according to Figure 8. Dimensions shall be in accordance with Table 10.

Figure 8 — Reducing tee

7.1.5 Dished ends

Dished ends shall be produced according to Figure 9. Dimensions shall be in accordance with Table 11. Furthermore, the following indications apply :

- R : approximately equal to D ;
- r : approximately equal to $0,1D$.

Figure 9 — Dished end

7.1.6 Caps

Caps shall be produced according to Figure 10. Dimensions shall be in accordance with Table 12. Furthermore, the following indications apply :

R : approximately equal to $0,8D$;

r : approximately equal to $0,15D$.

Figure 10 — Cap

350	355,6	8,0	165
400	406,4	8,8	178

7.2 Tolerances on dimensions

7.2.1 Diameter tolerances (D and D₁)

7.2.1.1 The relevant diameters shall be measured at the welding ends of the fittings. The tolerance is :

± 1 % or ± 0,5 mm, whichever is the greater

7.2.1.2 In order to ensure the flow-way area through the fitting is not excessively reduced, the internal diameter (not applicable to dished ends and caps) shall be greater than 80 % of the theoretical internal diameter (ID), as calculated by :

$$ID = D - 2T$$

7.2.1.3 Tolerances for ovality are :

at the welding ends : 2 % ;

on the body for elbows and return bends : 4 %.

The ovality (Ov) shall be calculated by :

$$Ov = 200 * (D_{max} - D_{min}) / (D_{max} + D_{min}) \text{ in \%}.$$

Where :

D_{max} : maximum measured diameter in one section ;

D_{min} : minimum measured diameter in the same section.

7.2.2 Wall thickness tolerances

Wall thickness tolerances shall comply with the requirements given in Table 13.

Table 13 — Wall thickness tolerances at the welding ends

D mm	T mm	Tolerance	
		Minus	Plus
≤ 406,4	≤ 4		+ 20 %
	> 4	- 12,5 %	+ 15 %

The minus tolerance applies also for the body of the fitting.

7.2.3 Tolerances on specific dimensions

For the dimensions specific to fittings, the tolerances shall comply with the requirements given in Table 14.

Table 14 — Tolerances on specific dimensions in millimetres

D	F-G-H	B	C	K	L
≤ 114,3	± 2	± 7	± 7	± 4	± 2
114,3 < D ≤ 219,1	± 2	± 7	± 7	± 7	± 3
219,1 < D ≤ 406,4	± 3	± 7	± 10	± 7	± 5

7.2.4 Tolerances on the form of fittings

The tolerance on the form of each type of fitting (out-of-squareness, alignment) is :

Q = 1 % of the diameter D at the point measured or 1 mm, whichever is the greater.

See Figure 11.

7.3 End finishing

7.3.1 At the manufacturer's option, for specified wall thicknesses below 3 mm, the ends may be slightly chamfered. For wall thicknesses equal to or above 3 mm, the ends shall be bevelled with an angle of $30^{\circ} - 0 + 5^{\circ}$ with a face of $1,6 \text{ mm} \pm 0,8 \text{ mm}$. Where necessary the dimensions at the welding ends may be achieved by taper boring of the inside surface with an angle of 18° and/or of the outside surface with an angle of 30° , the angles being related to the axis of the fitting. See Figure 12.

Fitting ends shall be free from harmful burrs.

7.3.2 The ends of dished ends with diameter equal or above 159 mm shall be bevelled with an angle of $30^{\circ} - 0 + 5^{\circ}$ with a face of $1,6 \text{ mm} \pm 0,8 \text{ mm}$.

Figure 11 — Tolerance on the form of fittings

Figure 12 — End finishing

8 Appearance, imperfections and repair

8.1 Appearance

The fittings shall be visually inspected after final deformation and, where applicable, after heat treatment and without being protected with any coating.

The fittings shall have smooth external and internal surfaces, the degree of smoothness depending on the method of manufacture.

8.2 Imperfections

The fittings shall have a workmanlike finish but small imperfections are permissible, provided that the wall thickness remains within the tolerance limits.

Score marks (linear mechanical scratches caused by the deformation process) shall not have a depth greater than 1,6 mm or 12,5 % of the wall thickness, whichever is greater. The bottom of the marks shall be rounded and not sharp.

8.3 Repair

Surface imperfections may be dressed provided that the wall thickness after dressing remains within the tolerance limits.

After dressing, the outside diameter may locally fall below the specified minimum (see 7.2.1.1) provided the wall thickness remains within the tolerance limits.

Repair by hammering is not permitted. Repair by welding may be permitted by agreement on welds made with filler metal and according to a procedure agreed by the purchaser.

9 Inspection and testing

9.1 General

Fittings shall be delivered with non specific inspection (see EN 10021).

9.2 Inspection documents

9.2.1 Fittings shall be delivered with a test report 2.2 in accordance with EN 10204. The approval reference of the quality system shall be indicated on the inspection document.

9.3 Summary of inspection and testing

The type of inspections and tests to be performed is given in Table 15.

Table 15 — Inspection and tests

Inspection and testing	Paragraph in the standard	Number of tests
Chemical analysis	9.4.1	Base material
Tensile test ($D > 114,3$ mm)	9.4.2	R
Hardness test ($D \leq 114,3$ mm)	9.4.3	R
Dimensional inspection	9.4.4	S
Visual examination	9.4.5	S
NDT of the weld when welding is part of the fitting manufacturing process	9.4.6	I
R : Statistical result representative of the manufacturing process ; S : Statistical inspection at the option of the manufacturer ; I : Individual. The representativity of the statistical results (indicated by R) shall be documented in a written procedure.		

9.4 Inspection and test methods

9.4.1 Chemical analysis

The chemical analysis of each cast shall be carried out by the steel manufacturer.

9.4.2 Tensile test at room temperature

The test shall be carried out according to EN 10002-1. The test piece shall be taken in the longitudinal direction and shall not be flattened.

The test may be carried out on a finished product, an intermediary piece or an overlength provided that the metallurgical condition corresponds to the delivery condition.

9.4.3 Hardness test

For fittings with $D \leq 114,3$ mm a Brinell hardness test may be carried out in lieu of a tensile test. It shall be carried out in accordance with EN 10003-1 on the outside surface of the fittings or in accordance with any other suitable method where the results can be converted to Brinell hardness numbers.

9.4.4 Dimensional inspection

The actual method for measuring fittings includes calculation from theoretical values. A written procedure for this calculation and measurement shall be produced by the manufacturer and held in his quality system.

9.4.5 Visual examination

Fittings shall be visually examined under normal conditions with adapted lighting to detect imperfections on the inside and outside surfaces.

9.4.6 NDT of the weld

Where welding is part of the fitting manufacturing process, the weld shall be nondestructively tested for the detection of imperfections.

The NDT method is at the discretion of the manufacturer and shall be reported.

10 Marking

Each fitting shall be legibly marked. The marking shall include the information given in Table 16 as a minimum.

Table 16 — Marking

	Fitting diameter mm	
	≤ 88,9	> 88,9
Symbol for the country where deformation is carried out ^a	Yes	Yes
Manufacturer's mark	Yes	Yes
Steel grade	Yes	Yes
Letter W (for welded fittings)	Yes	Yes
Outside diameter D ^b	Yes	Yes
Reference to this European Standard ^b	No	Yes
For reducers and reducing tees the marking shall include D ₁ and T ₁		
^a For the meaning of deformation, see Table 1. For symbols, see ISO 3166.		
^b For fittings with D ≤ 88,9 mm, these markings may be reported on the packaging or the attached tag.		

Unless otherwise agreed, marking shall be carried out by die-stamping.

11 Protection and packaging

Fittings shall be delivered in the bare condition or coated, at the discretion of the manufacturer.

For $D \leq 60,3$ mm, the fittings shall be delivered packaged.

Option 2

The coating shall be as defined in the order.

Annex A (normative)

Alternative specification for all types of fittings

As an alternative to certain requirements defined in this European Standard this annex specifies another steel grade and other dimensions D and T applicable to all types of fittings, with all possible reducing combinations being extrapolated in the same manner as the tables in the main text.

The steel grade defined in this annex shall exclusively be used in combination with the dimensions defined in this annex.

A.1 Steel grade

A.1.1 Chemical composition

The cast analysis as reported by the steel manufacturer shall comply with the requirements given in Table A.1.

Table A.1 — Chemical composition

Steel grade	C max. %	Si max. %	Mn max. %	S max. %	P max. %
S 265	0,20	0,40	1,40	0,025	0,030

NOTE Elements not included in this table shall not be intentionally added to the steel without agreement of the purchaser, with the exception of elements used for deoxidation. However, residual elements may be tolerated provided that the mechanical properties and applicability of the product are not adversely affected.

A.1.2 Mechanical characteristics

The mechanical characteristics (at room temperature) shall comply with the requirements given in Table A.2.

Table A.2 — Guaranteed mechanical characteristics

Steel Grade	R _{eH} min. N/mm ²	R _m N/mm ²	A min. %	HB max.
S 265	265	410-570	21	180

A.2 Dimensions

The outside diameter and wall thickness to be specified are listed in Table A.3.

All other relevant dimensions and tolerances shall be in accordance with this European Standard.

In this case the marking shall include (under the conditions defined in clause 10) the wall thickness T.

Table A.3 — Outside diameter and wall thickness, in millimetres

350	355,6	9,5 11,1
400	406,4	9,5 12,7

Annex B (informative)

A-deviation

A-deviation : National deviation due to regulations, the alteration of which is for the time being outside the competence of the CEN/CENELEC member.

This European Standard does not fall under any Directive of the EC.

In the relevant CEN/CENELEC countries, these A-deviations are valid instead of the provisions of this European Standard until they have been removed.

Sweden (Ordinance AFS 1994:39)

According to Chapter 3, Section 1, in the Ordinance AFS 1994:39, it is stated that the materials of a pressure-retaining device shall be such as to offer adequate safety.

In the comments on Section 1 above, it is stated that it is important that, in the case of steels, each steel grade is correctly specified with its specific properties and that it has a sufficient impact energy and is sufficiently ductile at the minimum working temperature.

As none of the two mentioned steel grades in EN 10253-1 has a specified impact energy, this draft European Standard is in conflict with the Ordinance AFS 1994:39.
